

ABSTRACT OF THE DISCLOSURE

5 A separator for a fuel cell is manufactured by
preparing a raw material powder, uniformly mixing the
prepared raw material to be formed into a slurry, and
charging the raw material powder derived from granulation
into a metal mold for heat press forming. The raw material
is obtained by adding to carbon powder a binder containing
a mixture of phenolic resin and epoxy resin. Therefore the
10 heat press forming step does not cause the binder to
generate gas, thus allowing manufacturing of a separator
exhibiting sufficient gas-impermeability.
